SIMulation Constructive pour l'Evaluation fonctionnelle (SIMCOE) - Constructive simulation for functional evaluation

Catchline

SIMCOE, one of the tools supporting the qualification work for the Laboratory for collaborative terrestrial combat LCCT (Laboratoire du Combat Collaboratif Terrestre)

Background

A real digital “sandpit”, the SIMCOE workshop is a vital tool for evaluating collaborative terrestrial combat, and the SCORPION system of systems in particular. It thus enables the testing of a large number of engagement configurations for SCORPION units, at a lower cost and in a controlled environment.

Expertise

The SIMCOE workshop has a set of cold data exploitation and visualisation tools to evaluate the performance of collaborative terrestrial combat algorithms: graphical, visualisation on a cartographic background, etc.

Its visual interface makes it a didactic tool which helps make SCORPION’s collaborative functions more understandable to a non-specialist audience.
